

DRI TM **ERV_i**
Energy Recovery Ventilators

You check the Quality of :

The Food – you eat ! The Water – you drink !

Do you also check the quality of – The Air you breathe . . . ?

The EPA* has reported that indoor air quality can be up to 10 times WORSE than the air outside.

Should You Be Concerned About Indoor Air Quality (IAQ)?

Indoor Air Quality (IAQ) has become an important health as well as productivity issue. The modern construction practices have led to airtight buildings which minimize the amount of fresh air entering and circulating within the building. This restriction impacts indoor air by allowing a build-up of air contaminants within the building that are not properly removed. We spend 90% of our lives indoors, where air quality is frequently up to 10 times more polluted than the air outdoors. Conditioned indoor air without the inclusion of adequate amount of outside air can have a high concentration of respirable dust, pollen, mold, spores, bacteria, viruses and more. People working indoors often experience symptoms such as dryness and irritation of the eyes, nose, throat and skin, headaches, shortness of breath, hyper sensitivity, allergies, coughing or nausea just to mention a few.

Some of the Indoor Air Contaminants

Source	Contaminant
Building occupants	Carbon dioxide (CO ₂), tobacco smoke, perfume, body odors.
Building materials	Dust, fiberglass, asbestos, gases including formaldehyde.
Workplace cleansers, solvents, pesticides, disinfectants, glues	Toxic vapors, volatile organic compounds (VOCs).
Furniture, carpets and paints	Gases, vapors, odors.
Carpets, fabric, foam cushions	Dust mites
Photocopiers, electric motors, electrostatic air cleaners	Ozone.

We generally notice poor Indoor Air Quality (IAQ) symptoms after several hours at work and feel better after we have left the building or when we have been away from the building for a weekend or a vacation.

The Sick Building Syndrome (SBS)

Occupants of buildings with poor IAQ report a wide range of health problems which are often called **Sick Building Syndrome (SBS)** and **Building-Related Illness (BRI)**.

The term **Sick Building Syndrome (SBS)** is used to describe cases in which building occupants experience adverse health effects that are apparently linked to the time they spend in the building. However, no specific illnesses or cause can be identified.

Building-Related Illness (BRI) refers to less frequent (but often more serious) cases of people becoming ill after being in a specific building at a certain time. In these cases, there is usually a similar set of clinical symptoms experienced by the people and a clear cause can often be found upon investigation. Legionnaires disease is an example of BRI caused by bacteria which can contaminate a building's air conditioning system.

Healthy Air to Healthy People

*The Environmental Protection Agency (EPA) is a US government agency concerned with the American environment and its impact on human health. The EPA is responsible for establishing and enforcing environmental standards under measures like the Clean Air Act

The Solution

Energy Recovery Ventilators

lets you enjoy the fresh-air feel of an open window, with virtually little or no heat or energy loss.

- ◆ Replace stale, polluted indoor air with fresher, healthier and oxygen rich outside air.
- ◆ Ideal for tightly sealed new commercial buildings and modern homes.
- ◆ Compact unit size allows it to be retrofitted with your existing air-conditioning system to enhance the indoor air quality.

How does it work ?

The heart of the Energy Recovery Ventilator is the **EcoFresh** desiccant coated energy recovery wheel, which slowly rotates between its two sections. In one section, the stale, conditioned air is passed through the wheel, and exhausted to the atmosphere. During this process, the wheel absorbs sensible and latent energy from the conditioned air, which is used to pre-condition the incoming Fresh Air in the other section, during the second half of its rotation cycle. Thus, you can have more Fresh Air at lower energy costs inside your conditioned space.

DRI ERVi is the first choice of an HVAC engineer and architect as it provides triple advantage of :

- ◆ better IAQ
- ◆ energy saving
- ◆ humidity control

Ideal for :

- ◆ **Residential** : Apartment Complexes, Homes, Luxury Villas
- ◆ **Light Commercial** : Showrooms, Pubs, Gyms, Spas, Beauty Saloons, Cafeterias
- ◆ **Commercial** : Cabins, Conference Rooms, Institutions, Labs, Speciality Clinics, Offices, Auditoriums and other Air conditioned environment for human comfort . . .

Monitor your IAQ with **ECO FRESH™** CO₂ Sensor

When indoor pollutants level go up, the productivity in your office comes down !
Monitor your IAQ with CO₂ Sensor

CO₂ Sensor is used as a surrogate ventilation index for diagnosing ventilation inefficiency or distribution problems. As the number of people in the building increases or the level of activity goes up, so will be the CO₂ concentration. High Concentration of CO₂ indicates poor Indoor Air Quality (IAQ) which causes drowsiness, discomfort and an inability to retain information and respond . . . low productivity.
EcoFresh CO₂ Sensor detects and displays the parts per million (ppm) of CO₂ in the air. The unit may be mounted on a wall or ceiling of the occupied spaces of a building or in an aspiration box attached to the return air duct.

CO₂ can be Monitored as well as Controlled

CO₂ control provides a good balance between comfort control and energy savings by assuring an adequate amount of fresh air based on actual occupancy.

CO₂ Sensor controls the ventilation system according to ventilation requirements (**ASHRAE standard 62**). The unit may be mounted on a wall or ceiling of the occupied spaces of a building or in an aspiration box attached to the return air duct.

EcoFresh CO₂ – ideal for Monitoring IAQ in . . .
